

CLAIMS

1. Electric machine with a squirrel-cage rotor, characterized in that the squirrel-cage rotor has a cage winding made of flexible conductors (L1, L2).
2. Electric machine according to claim 1, characterized in that the flexible conductors (L1, L2) are stranded wires.
3. Electric machine according to claim 1 or 2, characterized in that the stranded wires are arranged in a meander pattern, running in opposite directions in the slots (n, n+1, n+2) of the squirrel-cage rotor, so as to establish the cage connection already in the rotor.
4. Electric machine according to claim 1, 2 or 3, characterized in that the stranded wires are electrically contacted at least inside a slot (n, n+1, n+2).
